GraphBLAS operations and methods. Notation: Matrices and vectors are typeset in bold, starting with uppercase (\mathbf{A}) and lowercase (\mathbf{u}) letters, respectively. Scalars including indices are lowercase italic (k, i, j) while arrays are lowercase bold italic (\mathbf{x} , \mathbf{i} , \mathbf{j}). \oplus and \otimes are the addition and multiplication operators forming a semiring and default to conventional arithmetic + and \times operators. \odot is the accumulator operator. Operations can be modified via a descriptor; matrices can be transposed (\mathbf{B}^{T}), the mask can be complemented ($\mathbf{C}\langle\neg\mathbf{M}\rangle$), and the mask can be valued (shown above) or structural ($\mathbf{C}\langle s(\mathbf{M})\rangle$). A structural mask can also be complemented ($\mathbf{C}\langle\neg s(\mathbf{M})\rangle$). The result can be cleared (replaced) after using it as input to the mask/accumulator step ($\mathbf{C}\langle\mathbf{M},\mathbf{r}\rangle$). Not all methods are listed (creating new operators, monoids, and semirings, clearing a matrix/vector, etc.).
